Hvad gør Google egentligt

How Google works

All of us use it on a daily basis. Yet, we barely know how few keywords can return such massive results for hundreds of pages

how to hack a password

Google Search I'm Feeling Lucky

Query box

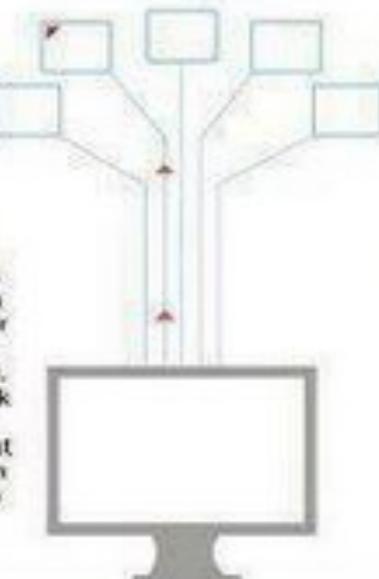

It all starts with somebody typing in a request for information about how to hack a password, safest city in India, or what the prime rate is in BSE

2

Domain name servers

"Hello, this is your operator..."

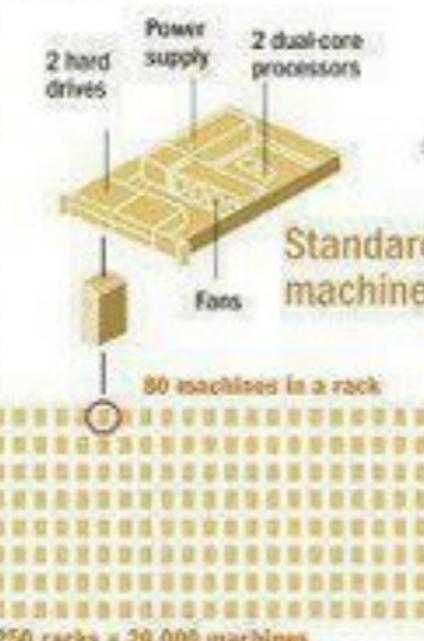

The software for Google's domain name servers run on computers in leased or company-owned data centres all over the world. Its sole purpose is to flock searches into Google's clusters which are nearest to the searcher and which are least busy at the time of the search, as efficiently as possible.

3

Cluster control

Google's genius lies in its networking software, which helps thousands of cheap computers in a cluster act like one huge hard drive. Those computers allow Google to replace parts without stopping the whole show. If a computer stops, there are at least two others ready to take its place while an engineer swaps out the busted machine.

The cluster
The request continues into one of at least 200 clusters, owned by Google's data centres worldwide.

4

Inside a Google cluster

WEB SERVER

This program splits a query among thousands of machines so that they can all work in it at the same time. It's the difference between doing your grocery shopping all by yourself and having 100 people simultaneously find one item and toss it into your cart.

INDEX SERVER

Everything Google knows is stored in a huge database. But rather than waiting for one computer to sift through them, Google has hundreds of computers that scan its 'card catalogue' at the same time to find every relevant entry. Popular searches are cached-held in memory for a few hours rather than run all over again.

DOCUMENT SERVER

The document server pulls all the relevant links and snippets of text from database. Though it seems like Google search the Web so quickly, Google keeps three copies of all the information from the internet that it has indexed in its own document servers, and all those data have already been prepared and sorted.

SPELLING SERVER

Google doesn't read words. It looks for patterns of characters, be they in English or Sanskrit. If it sees your requested pattern a thousand times but finds a million hits for a similar pattern that's off by one character, it connects the dots and suggests what you probably meant, even while it provides you results.

AD SERVER

Each query is simultaneously run through an ad database and matches are fed to the Web server to be placed on the results page. If ad results take longer to pull up than the search results, they won't make it onto the page and Google won't make money on that search.

PAGE BUILDER

The Google Web server collects the results of the n number of operations it runs for a query, organises all the data, and draws Google's simple results page on your browser window, all in less time than it took you to read this.

INDEN man søger

Index

Kæmpe samling af indhold fra milliarder af sider

Google vil prøve på at forstå indholdet

Algoritmer, synonymer, stavelser, location,
tidligere historik, relaterede søgninger, trends +
???

Google bedømmer kvaliteten af ens indhold

hvem linker til det, hvor troværdig en side er
man, hvor på siden/koden står søgeordene, hvor
hurtigt loader de, er siden mobil venlig +
???

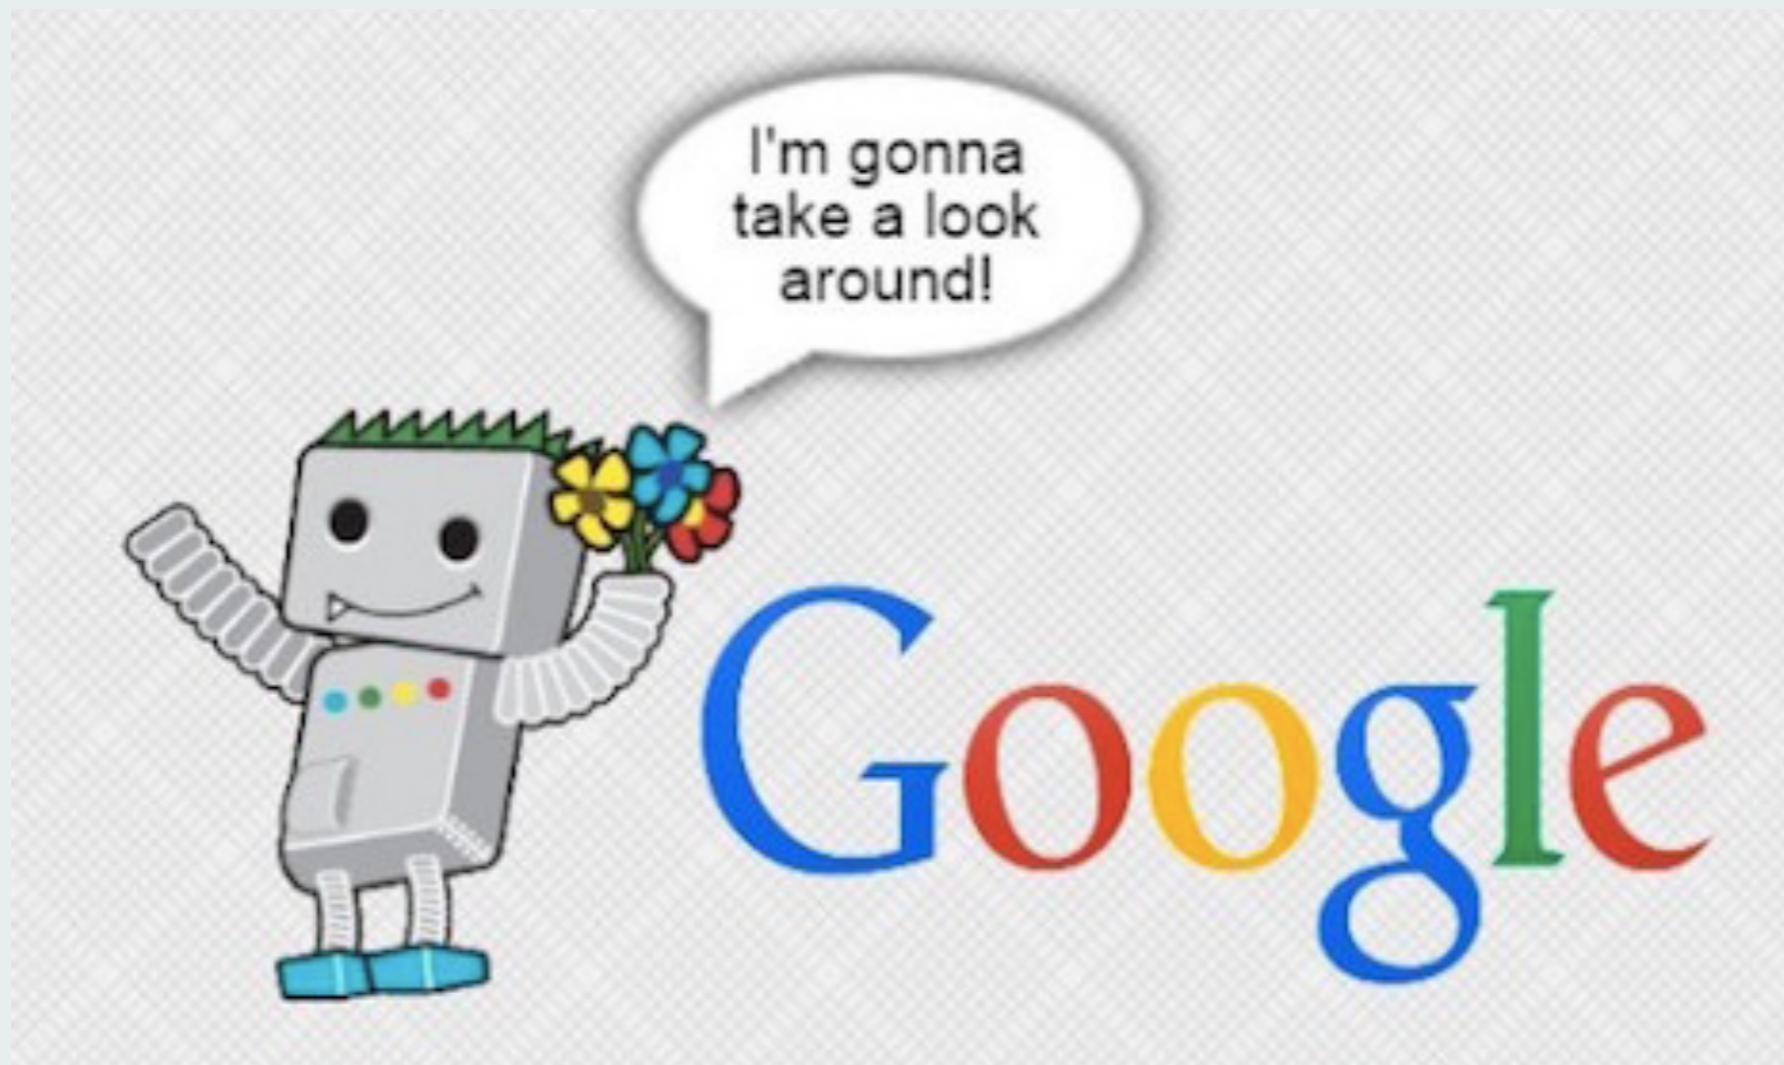

Page Rank

Et tal på kvaliteten og relevansen af ens side

Indexing

Det at samle indhold ind fra sider på nettet

Spiders, crawlers, google-bots

Hvad sker der så når man søger?

ALGORITHMS

get to work looking for clues
to better understand what
you mean.

Semantic Markup

Make your content understandable
to humans AND machines

Search engines try to understand
content like a human.

Help them.

Use **semantic** markup.

Don't just add content,
say what it is.

Text markup

<h1> - <h6>

<p>,,

,

<address>

Structure markup

<section>, <article>, <aside>
<nav>, <header>, <footer>

Don't use empty tags

<div>,

Unless you **need** to

Remember alt attributes

```
<img alt="this text should convey  
the same meaning as the image">
```

*These are text versions of what
the images and should be able to
replace the image.*

This is bad

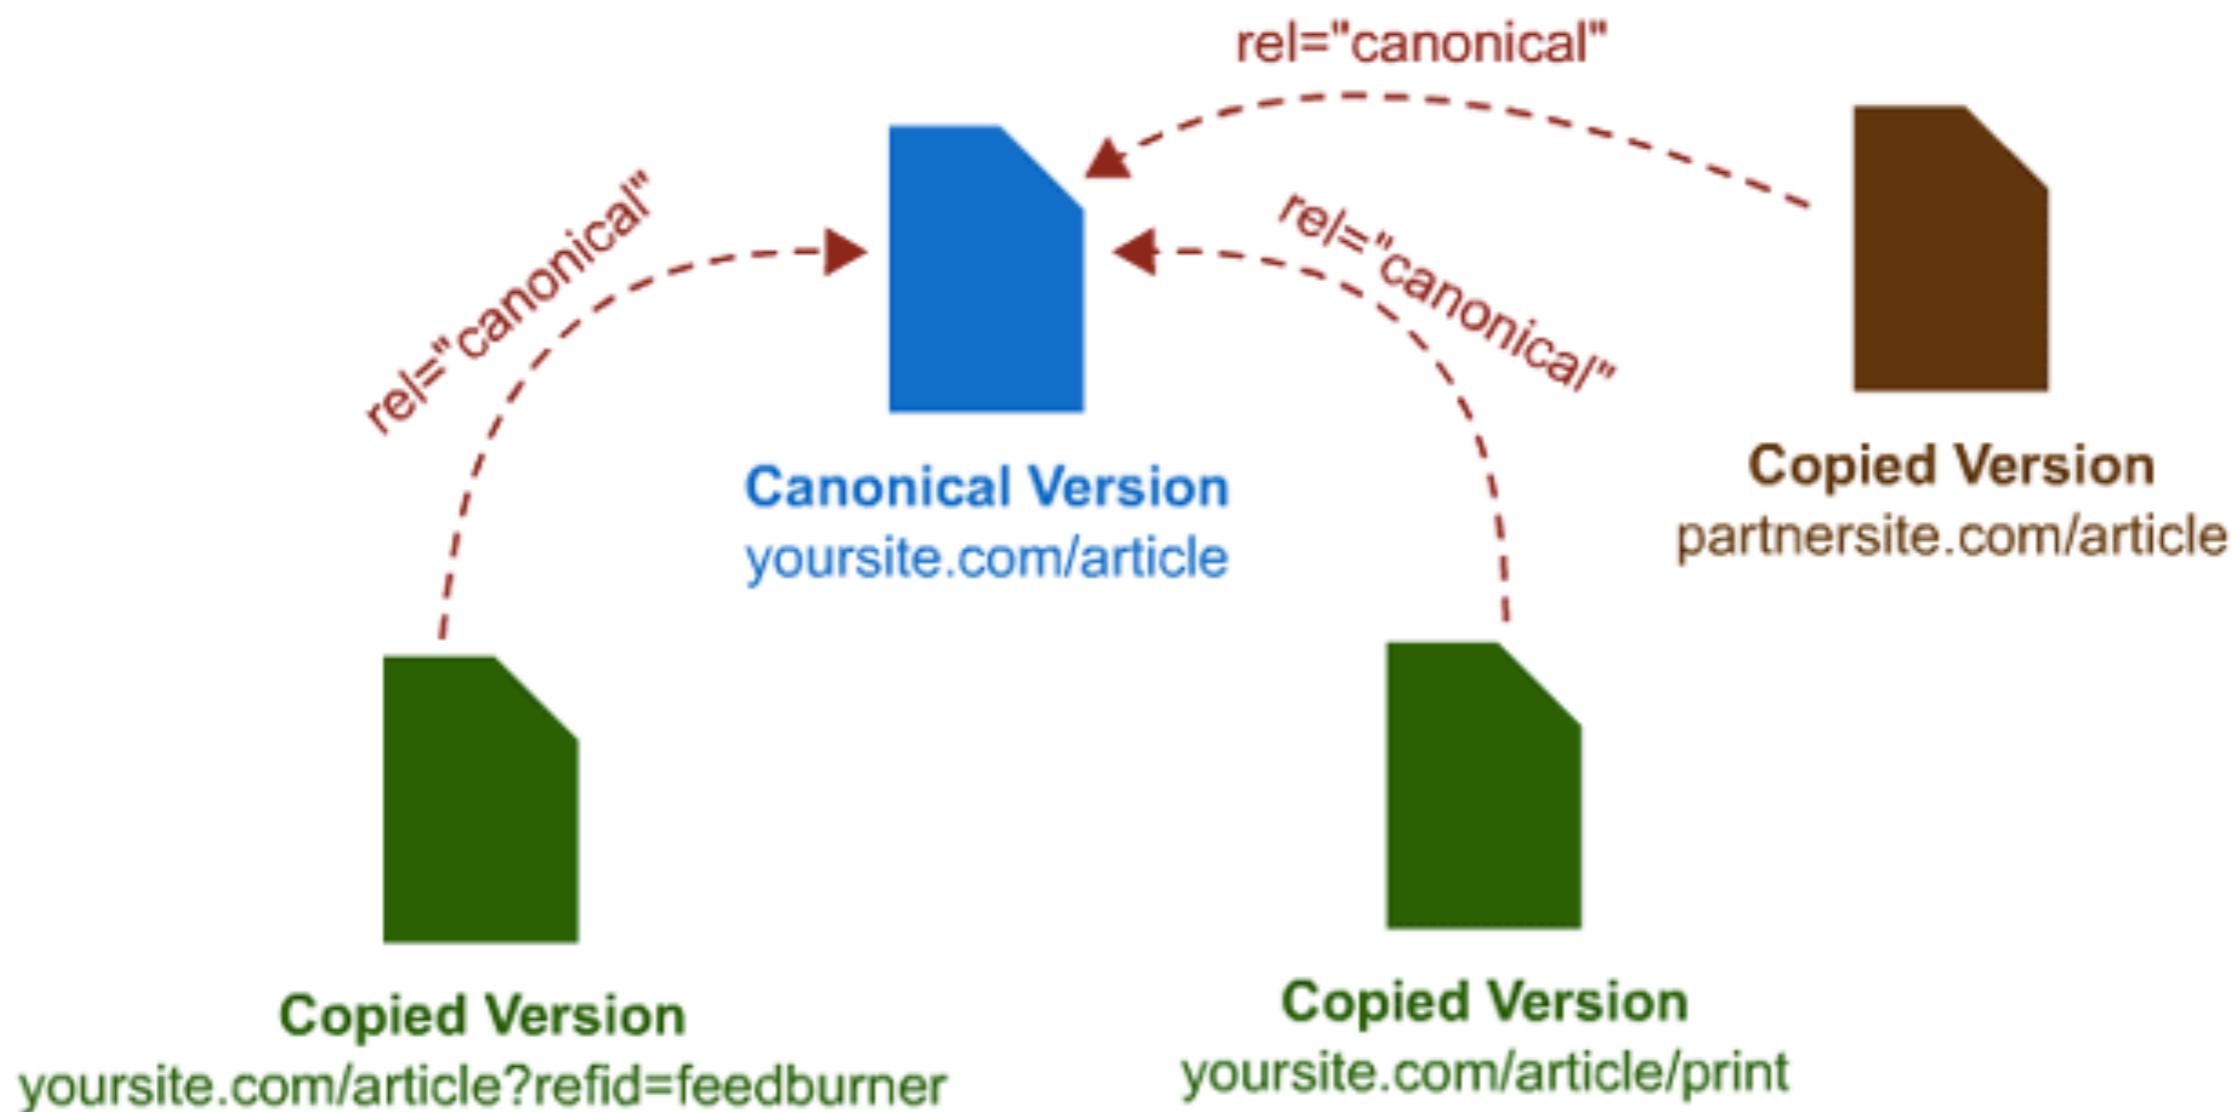

This is worse

*Yeah, this is what apple.com is doing.
Douchebags...*

Extend HTML markup with Microdata

Allows you to say something about:

- Events
- People
- Products
- Reviews
- Opening Hours
- Etc
